NOTIFICATION DATE

DELIVERY MODE

08/10/2010

ELECTRONIC

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

NBN-IntelProp@bshg.com

### Office Action Summary

**Application No.**

10/575,035

**Applicant(s)**

JERG, HELMUT

**Examiner**

STEPHEN KO

**Art Unit**

1714

**-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --**  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 11 June 2010.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 22, 25-27 and 29-42 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 22, 25-27 and 29-42 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB-06)  
Paper No(s)/Mail Date \_\_\_\_\_

- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date \_\_\_\_\_
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_

## DETAILED ACTION

### *Claim Objections*

1. The objection to Claim 40 is withdrawn in view of applicant's amendment.

### *Claim Rejections - 35 USC § 103*

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
  2. Ascertaining the differences between the prior art and the claims at issue.
  3. Resolving the level of ordinary skill in the pertinent art.
  4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
4. Claims 22, 25, 29-30, 37-39 and 42 are rejected under 35 U.S.C. 103(a) as being unpatentable over DE 196 22 882 in view of DE 196 47 567.

For claims 37-39 and 22, DE'882 teaches a dishwasher comprising a washing container having a plurality of walls (Fig.1, #1); a heat damping layer (Fig.1, #3, #4, #5, #6, and #7), comprising an intermediate layer (Fig.1, #3) and a latent heat storage (Fig.1, #5), at the dishwasher's outer surface (abstract), wherein the intermediate layer of the heat damping layer only allows heat crossing from the washing container to the latent heat storage during the drying procedure (read as heat damping layer having

variable thermal conductivity in that the heat damping layer can be adjusted between at least a first thermal conductivity value at which thermal conductivity through the heat damping proceeds at a first rate and a second thermal conductivity value at which thermal conductivity through the heat damping proceeds at a second rate different than the first rate, P.2, L.4-16, See translation). Note that the heat damping layer (DE'882, Fig.1, #3, #4, and #5) is in heat-conducting contact with one of walls of the washing container and with an outer wall of the dishwasher (DE'882, P.2, L.4, See translation and abstract) and is intermediate the one wall of the washing container and the outer wall of the dishwasher (Fig.1).

DE'882 does not teach a heat damping layer containing a closed capsule containing hydrogen in which at least one metal hydride grid is arranged, which can form a chemical compound with the hydrogen and thus bind the hydrogen, the capsule has a selected one of a pressed glass and a non-pressed glass fibre core that is surrounded by a gastight jacket made of a selected one of a stainless steel sheet and a non-stainless steel sheet, the heat damping layer is configured such that heating of the capsule has the effect that the hydrogen previously bound in the metal hydride grid is released, the pressure in the capsule increases, and the thermal conductivity of at least one of the capsule and the entire heat damping layer is increased and the heat damping layer is configured such that cooling of the capsule has the effect that the free hydrogen is resorbed with the metal hydride grid in a chemical compound, the pressure in the capsule drops, and the thermal conductivity of at least one of the capsule and the entire heat damping layer is decreased, wherein a given portion of the variable heat damping

layer has its thermal content respectively increased in correspondence with the heating of the capsule of the variable heat damping layer and decreased in correspondence with the cooling of the capsule of the variable heat damping layer. DE'882 also does not teach the thermal conductivity value of the heat damping layer is thereby dependent on the pressure in the capsule.

DE'567 teaches a variable heat conductivity insulation panel (read as heat damping layer, title) comprising an evacuated cladded structure (read as gastight jacket, abstract) containing a structured insulating material formed by glass fiber (read as capsule, abstract) enclosing hydrogen metal hydride (abstract and P.2, L.25, See translation) electrically heated in the panel (read as a given portion of the heat damping layer has its thermal content respectively increased in correspondence with the heating of the capsule and decreased in correspondence with the cooling of the capsule and the heat damping layer containing a closed capsule, p.2, L.25-26, See translation), wherein the heat conductivity insulation panel is configured such that heating of the capsule of the variable conductivity insulation panel has the effect that the hydrogen previously bound in the metal hydride grid is released, the pressure in the capsule increases, and the thermal conductivity of at least one of the capsule and the entire heat conductivity insulation panel is increased and the heat conductivity insulation panel is configured such that cooling of has the effect that the free hydrogen is resorbed with the metal hydride grid in a chemical compound, the pressure in the capsule drops, and the thermal conductivity of at least one of the capsule and the entire heat conductivity insulation panel is decreased (DE'567, P.2, L.18-27, See translation). Also note the heat

conductivity insulation panel is heated with an electrical heating (DE'567, P.2, L.30-31, See translation) and operable to function at temperature of at least 300 degree Celsius (P.2, L.24-32, See translation). Moreover, note that the thermal conductivity value of the heat conductivity insulation panel is thereby dependent on the pressure of the capsule because DE'567 clearly shows that when the pressure increases, the thermal conductivity value also increases (DE'567, P.2, L.16-20, see translation).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the dishwasher of DE'882 to utilize a heat damping layer as mentioned in DE'567 instead of the heat damping layer of DE'882 to have a vacuum insulation and enhance insulation efficiency.

For claim 25, both DE'882 and DE'567 do not teach an internal pressure of the heat damping layer being about 0.01mbar at room temperature and about 50mbar at a temperature of about 300 degree Celsius. Note that DE'567 teaches an internal pressure of the variable heat conductivity insulation panel being smaller than 0.01 mbar (read as about 0.01mbar, P.2, L.19, See translation).

Regarding claim 25, reciting an internal pressure of the capsule of the heat damping layer at a particular temperature, it is noted that the internal pressure at the particular temperature depends on the type and amount of metal hydride that is used, one skilled in the art would have been found obvious at the time the invention was made to choose a most suitable and amount of metal hydride to enhance the performance of the thermal insulation and conduction of the heat damping layer, as it only involves routine experiments.

Regarding claim 42, reciting a pressure difference in the capsule between when the thermal conductivity value of the heat damping layer is increased versus when it is decreased is on an order of 5000 times, it is noted that the internal pressure at the particular temperature/thermal conductivity value depends on the type and amount of metal hydride that is used, one skilled in the art would have been found obvious at the time the invention was made to choose a most suitable and amount of metal hydride to enhance the performance of the thermal insulation and conduction of the heat damping layer, as it only involves routine experiments.

For claim 29, note that the variable heat damping layer is disposed in a side wall of the dishwasher (DE'882, Fig.1, abstract).

For claim 30, DE'882 and DE'567 does not teach the heat damping layer is disposed in a selected one of the top and the bottom of the dishwasher.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the attachment position of the variable heat damping layer of combined teaching of DE'882 and DE'567 as it is a matter of design choice, consult, *In re Japikse*, 181 F.2d 1019, 86 USPQ 70 (CCPA 1950).

5. Claims 26-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over DE 196 22 882 in view of DE 196 47 567 in further view of Bovenkerk (US 3,167,159).

DE'882 and DE'567 teach a dishwasher cited above.

DE'882 and DE'567 do not teach a controlling means to control the thermal conductivity of the variable heat damping layer, such that the variable heat damping layer is continuously adjustable to arbitrary thermal conductivity value between the first

and second thermal conductivity value and the variable heat damping layer having thermal conductivity value approximately in a range between  $0.3\text{W/m}^2\text{K}$  and  $10\text{W/m}^2\text{K}$ . Note that DE'567 teaches an electrical heating (DE'567, P.2, L.30-31, See translation) to adjust the thermal conductivity of the variable heat conductivity insulation panel (read as the heat damping).

Bovenkerk teaches an insulating structures with variable thermal conductivity comprising an electrical heater (Fig.1, #19, col.4, L.45) coupled to a control, which is a rheostat (read as controlling means which is fully capable of continuously adjustable to an arbitrary thermal conductivity value between the first and second thermal conductivity value, Fig.1, #20, col.4, L.47). Note that Bovenkerk also discloses that the thermal conductivity value depends on an internal pressure (Fig.8)

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the dishwasher of combined teaching of DE'882 and DE'567 by adding a controlling means to the heater as mentioned in Bovenkerk to control the thermal conductivity of the variable heat damping layer. Regarding claim 27, reciting thermal conductivity value approximately in a range between  $0.3\text{W/m}^2\text{K}$  and  $10\text{W/m}^2\text{K}$ , it is noted that the thermal conductivity value depends on an internal pressure at particular temperature, which also depends on the type and amount of metal hydride that is used, one skilled in the art would have been found obvious at the time the invention was made to choose a most suitable and amount of metal hydride to enhance the performance of the internal insulation and conduction of the heat damping layer, as it only involves routine experiments.

6. Claim 31 is rejected under 35 U.S.C. 103(a) as being unpatentable over DE 196 22 882 in view of DE 196 47 567 in further view of Lampman et al (US 4,746,177).

DE'882 and DE'567 teach a dishwasher cited above. Note that DE'882 teaches a dishwasher comprising a cooler surface (read as a wall of the washing container having at least a condensing surface, P.1, paragraph 2, See translation).

DE'882 and DE'567 do not teach a condensing surface made of flexible material comprising plastic film.

Lampman et al teach a dishwasher having a flexible plastic tub (col.5, L.57).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the dishwasher of DE'882 by using a flexible plastic tub as mentioned in Lampman et al to facilitate assembly.

7. Claims 32-35 are rejected under 35 U.S.C. 103(a) as being unpatentable over DE 196 22 882 in view of DE 196 47 567 in further view of JP 2002-336180.

DE'882 teaches a method for cleaning and drying tableware in a dishwasher comprising the steps of providing a washing container (Fig.1, #1); a heat damping layer (Fig.1, #3, #4, #5, #6, and #7), comprising an intermediate layer (Fig.1, #3) and a latent heat storage (Fig.1, #5), disposed at least partially surrounding the dishwashing container (Fig.1), wherein dishes in the dishwasher is heated during cleaning and/or rinsing process (P.1, paragraph 2, See translation) and the heat damping layer only allows heat crossing from the washing container to the latent heat storage during the drying procedure (read as disposing the heat damping layer at the relatively lower thermal conductivity value when thermal energy is built up during cleaning and/or

rinsing process in the washing container, and disposing the heat damping layer at the relatively higher thermal conductivity value during drying process, P.2, L.4-16, See translation). Note that DE'882 also teaches the step of providing the heat damping layer (DE'882, Fig.1, #3, #4, and #5) being in heat-conducting contact with one of walls of the washing container and with an outer wall of the dishwasher (DE'882, P.2, L.4, See translation and abstract)

DE'882 remains silent about the step of providing a heat generating means for generating heat in the washing container.

Examiner takes official notice that the use of electric heater to generate heat in the washing container is well known in the art.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method of DE'882 by adding an electric heater to generate heat in the washing container to perform the step of heating the dishes during cleaning and/or rinsing process as mentioned in DE'882.

DE'882 remains silent about the step of providing a heat damping layer containing a closed capsule containing hydrogen in which at least one metal hydride grid is arranged, which can form a chemical compound with the hydrogen and thus bind the hydrogen, the capsule has a selected one of a pressed glass and a non-pressed glass fibre core that is surrounded by a gastight jacket made of a selected one of a stainless steel sheet and a non-stainless steel sheet, the heat damping layer is configured such that heating of the capsule has the effect that the hydrogen previously bound in the metal hydride grid is released, the pressure in the capsule increases, and

the thermal conductivity of at least one of the capsule and the entire heat damping layer is increased and the heat damping layer is configured such that cooling of the capsule has the effect that the free hydrogen is resorbed with the metal hydride grid in a chemical compound, the pressure in the capsule drops, and the thermal conductivity of at least one of the capsule and the entire heat damping layer is decreased.

DE'567 teaches the steps of providing a variable heat conductivity insulation panel (read as heat damping layer, title) comprising an evacuated cladded structure (read as gastight jacket, abstract) containing a structured insulating material formed by glass fiber (read as capsule, abstract) enclosing hydrogen metal hydride (abstract and P.2, L.25, See translation) electrically heated in the panel (read as a given portion of the variable heat damping layer has its thermal content respectively increased in correspondence with the heating of the capsule and decreased in correspondence with the cooling of the capsule, and the closed capsule is within a given portion of the variable heat damping layer, p.2, L.25-26, See translation), wherein the heat conductivity insulation panel is configured such that heating of the capsule has the effect that the hydrogen previously bound in the metal hydride grid is released, the pressure in the capsule increases, and the thermal conductivity of at least one of the capsule and the entire heat conductivity insulation panel is increased; and the heat conductivity insulation panel is configured such that cooling of the capsule has the effect that the free hydrogen is resorbed with the metal hydride grid in a chemical compound, the pressure in the capsule of the variable heat conductivity insulation panel drops, and the thermal conductivity of at least one of the capsule and the entire heat conductivity

insulation panel is decreased (DE'567, P.2, L.18-27, See translation). Note that the thermal conductivity value of the heat conductivity insulation panel is thereby dependent on the pressure of the capsule because DE'567 clearly shows that when the pressure increases, the thermal conductivity value also increases (DE'567, P.2, L.16-20).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method of DE'882 by providing a heat damping layer as mentioned in DE'567 instead of the heat damping layer of DE'882 to have a vacuum insulation and enhance insulation efficiency.

DE'882 and DE'567 remain silent about the step of providing a dishwasher being operable to execute at least one washing program.

JP 2002-336180 teaches a dishwasher comprising the steps of providing a control means (read as program control, Fig.1, #101, abstract) to execute program (read as washing program, abstract).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method of combined teaching of DE'882 and DE'567 by providing a program control to execute at least one washing program, including the operation of the variable heat damping layer, as motivated by JP 2002-336180 to simplify dishwashing procedure.

8. Claim 36 is rejected under 35 U.S.C. 103(a) as being unpatentable over DE 196 22 882 in view of DE 196 47 567 and JP 2002-336180 in further view of Milocco (US 5,273,061).

DE'882, DE'567 and JP 2002-336180 teach a method for cleaning and drying tableware cited above.

DE'882, DE'567 and JP 2002-336180 remain silent about water deposited during the drying process in the washing container is passed from the washing container via at least one of discharge via a sump of the dishwasher, discharge via a discharge pump, and discharge via a means other than a sump or a discharge pump of the dishwasher. Note that DE'882 teaches a step of condensing humid air contained in the rinsing space atmosphere at a cooler surface of the washing container (P.1, paragraph 2, See translation).

Milocco teaches a method for drying process in a dishwasher comprising the steps of condensing vapor inside the washtub, and the condensate is collected on the bottom of the tub and evacuated by a discharge pump (col.2, L.38-45).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the method of combined teaching of DE'882, DE'567 and JP 2002-336180 by passing the water deposited during the drying process in the washing container from the washing container via a sump and discharging via a discharge pump as motivated by Milocco to reduce the humidity inside the washing container to enhance drying and prevent flooding inside the washing container.

9. Claim 40 is rejected under 35 U.S.C. 103(a) as being unpatentable over DE 196 22 882 in view of DE 196 47 567 in further view of Tilton et al (US 6,539,955).

DE'882 teaches a dishwasher comprising a washing container having a plurality of walls (Fig.1, #1); a heat damping layer (Fig.1, #3, #4, #5, #6, and #7), comprising an

intermediate layer (Fig.1, #3) and a latent heat storage (Fig.1, #5), at the dishwasher's outer surface (abstract), wherein the intermediate layer of the heat damping layer only allows heat crossing from the washing container to the latent heat storage during the drying procedure (read as heat damping layer having variable thermal conductivity in that the heat damping layer can be adjusted between at least a first thermal conductivity value at which thermal conductivity through the heat damping proceeds at a first rate and a second thermal conductivity value at which thermal conductivity through the heat damping proceeds at a second rate different than the first rate, P.2, L.4-16, See translation). Note that the heat damping layer (DE'882, Fig.1, #3, #4, and #5) is in heat-conducting contact with one of walls of the washing container and with an outer wall of the dishwasher (DE'882, P.2, L.4, See translation and abstract) and is intermediate the one wall of the washing container and the outer wall of the dishwasher (Fig.1).

DE'882 does not teach a heat damping layer containing a closed capsule containing hydrogen in which at least one metal hydride grid is arranged, which can form a chemical compound with the hydrogen and thus bind the hydrogen, the capsule has a selected one of a pressed glass and a non-pressed glass fibre core that is surrounded by a gastight jacket made of a selected one of a stainless steel sheet and a non-stainless steel sheet, the heat damping layer is configured such that heating of the capsule has the effect that the hydrogen previously bound in the metal hydride grid is released, the pressure in the capsule increases, and the thermal conductivity of at least one of the capsule and the entire heat damping layer is increased and the heat damping layer is configured such that cooling of the capsule has the effect that the free hydrogen

is resorbed with the metal hydride grid in a chemical compound, the pressure in the capsule drops, and the thermal conductivity of at least one of the capsule and the entire heat damping layer is decreased, wherein a given portion of the variable heat damping layer has its thermal content respectively increased in correspondence with the heating of the capsule of the variable heat damping layer and decreased in correspondence with the cooling of the capsule of the variable heat damping layer. DE'882 also does not teach the thermal conductivity value of the heat damping layer is thereby dependent on the pressure in the capsule.

DE'567 teaches a variable heat conductivity insulation panel (read as heat damping layer, title) comprising an evacuated cladded structure (read as gastight jacket, abstract) containing a structured insulating material formed by glass fiber (read as capsule, abstract) enclosing hydrogen metal hydride (abstract and P.2, L.25, See translation) electrically heated in the panel (read as a given portion of the heat damping layer has its thermal content respectively increased in correspondence with the heating of the capsule and decreased in correspondence with the cooling of the capsule and the heat damping layer containing a closed capsule, p.2, L.25-26, See translation), wherein the heat conductivity insulation panel is configured such that heating of the capsule of the variable conductivity insulation panel has the effect that the hydrogen previously bound in the metal hydride grid is released, the pressure in the capsule increases, and the thermal conductivity of at least one of the capsule and the entire heat conductivity insulation panel is increased and the heat conductivity insulation panel is configured such that cooling of has the effect that the free hydrogen is resorbed with the metal

hydride grid in a chemical compound, the pressure in the capsule drops, and the thermal conductivity of at least one of the capsule and the entire heat conductivity insulation panel is decreased (DE'567, P.2, L.18-27, See translation). Also note the heat conductivity insulation panel is heated with an electrical heating (DE'567, P.2, L.30-31, See translation) and operable to function at temperature of at least 300 degree Celsius (P.2, L.24-32, See translation). Moreover, note that the thermal conductivity value of the heat conductivity insulation panel is thereby dependent on the pressure of the capsule because DE'567 clearly shows that when the pressure increases, the thermal conductivity value also increases (DE'567, P.2, L.16-20, see translation).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the dishwasher of DE'882 to utilize a heat damping layer as mentioned in DE'567 instead of the heat damping layer of DE'882 to have a vacuum insulation and enhance insulation efficiency.

DE '882 and DE '567 remain silent about a sound damping layer surrounding the washing container and the heat damping layer is disposed between the sound damping layer and the walls of the washing container. Note that the dishwasher of combined teaching of DE'882 and DE'567 teach the heat damping layer being disposed in surface contact with at least part of the wall of the washing container (DE'882, Fig.3, the wall of #1, read as projecting structure).

However, Tilton et al teach a dishwasher comprising a sound damping layer (Fig.1a, #26, abstract) surrounding a washing container, wherein the sound damping layer fits snugly around projecting structures so as to eliminate gaps between the layer

and the structures and therefore acoustical leaks associated with those gaps (Tilton et al, col.2, L.51-54).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the dishwasher of combined teaching of DE '882 and DE '567 by adding a sound damping layer surrounding the washing container, wherein the sound damping layer fits snugly around projecting structures (in this case, the heat damping layer) as motivated by Tilton et al so as to eliminate gaps between the layer and the structures and therefore acoustical leaks associated with those gaps (Tilton et al, col.2, L.51-54). Therefore, the heat damping layer is disposed between the sound damping layer and the walls of the washing container in the combined teaching of DE '882, DE '567 and Tilton et al.

10. Claim 41 is rejected under 35 U.S.C. 103(a) as being unpatentable over DE 196 22 882 in view of DE 196 47 567 in further view of Williamson (US 3,387,382).

DE'882 teaches a dishwasher comprising a washing container having a plurality of walls (Fig.1, #1); a heat damping layer (Fig.1, #3, #4, #5, #6, and #7), comprising an intermediate layer (Fig.1, #3) and a latent heat storage (Fig.1, #5), at the dishwasher's outer surface (abstract), wherein the intermediate layer of the heat damping layer only allows heat crossing from the washing container to the latent heat storage during the drying procedure (read as heat damping layer having variable thermal conductivity in that the heat damping layer can be adjusted between at least a first thermal conductivity value at which thermal conductivity through the heat damping proceeds at a first rate and a second thermal conductivity value at which thermal conductivity through the heat

damping proceeds at a second rate different than the first rate, P.2, L.4-16, See translation). Note that the heat damping layer (DE'882, Fig.1, #3, #4, and #5) is in heat-conducting contact with one of walls of the washing container and with an outer wall of the dishwasher (DE'882, P.2, L.4, See translation and abstract) and is intermediate the one wall of the washing container and the outer wall of the dishwasher (Fig.1).

DE'882 does not teach a heat damping layer containing a closed capsule containing hydrogen in which at least one metal hydride grid is arranged, which can form a chemical compound with the hydrogen and thus bind the hydrogen, the capsule has a selected one of a pressed glass and a non-pressed glass fibre core that is surrounded by a gastight jacket made of a selected one of a stainless steel sheet and a non-stainless steel sheet, the heat damping layer is configured such that heating of the capsule has the effect that the hydrogen previously bound in the metal hydride grid is released, the pressure in the capsule increases, and the thermal conductivity of at least one of the capsule and the entire heat damping layer is increased and the heat damping layer is configured such that cooling of the capsule has the effect that the free hydrogen is resorbed with the metal hydride grid in a chemical compound, the pressure in the capsule drops, and the thermal conductivity of at least one of the capsule and the entire heat damping layer is decreased, wherein a given portion of the variable heat damping layer has its thermal content respectively increased in correspondence with the heating of the capsule of the variable heat damping layer and decreased in correspondence with the cooling of the capsule of the variable heat damping layer. DE'882 also does not

teach the thermal conductivity value of the heat damping layer is thereby dependent on the pressure in the capsule.

DE'567 teaches a variable heat conductivity insulation panel (read as heat damping layer, title) comprising an evacuated cladded structure (read as gastight jacket, abstract) containing a structured insulating material formed by glass fiber (read as capsule, abstract) enclosing hydrogen metal hydride (abstract and P.2, L.25, See translation) electrically heated in the panel (read as a given portion of the heat damping layer has its thermal content respectively increased in correspondence with the heating of the capsule and decreased in correspondence with the cooling of the capsule and the heat damping layer containing a closed capsule, p.2, L.25-26, See translation), wherein the heat conductivity insulation panel is configured such that heating of the capsule of the variable conductivity insulation panel has the effect that the hydrogen previously bound in the metal hydride grid is released, the pressure in the capsule increases, and the thermal conductivity of at least one of the capsule and the entire heat conductivity insulation panel is increased and the heat conductivity insulation panel is configured such that cooling of has the effect that the free hydrogen is resorbed with the metal hydride grid in a chemical compound, the pressure in the capsule drops, and the thermal conductivity of at least one of the capsule and the entire heat conductivity insulation panel is decreased (DE'567, P.2, L.18-27, See translation). Also note the heat conductivity insulation panel is heated with an electrical heating (DE'567, P.2, L.30-31, See translation) and operable to function at temperature of at least 300 degree Celsius (P.2, L.24-32, See translation). Moreover, note that the thermal conductivity value of the

heat conductivity insulation panel is thereby dependent on the pressure of the capsule because DE'567 clearly shows that when the pressure increases, the thermal conductivity value also increases (DE'567, P.2, L.16-20, see translation).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the dishwasher of DE'882 to utilize a heat damping layer as mentioned in DE'567 instead of the heat damping layer of DE'882 to have a vacuum insulation and enhance insulation efficiency.

DE '882 and DE '567 teach the walls of the washing container forming the volume are configured as condensing surfaces (DE '882, paragraph 4 of P.4 of the translation). However, DE '882 and DE '567 remain silent about the walls of the washing container made of a flexible material comprising a metal film having an aluminum component.

Williamson teaches a condensing means, which is made of a sheet of aluminum (read as condensing surface made of a flexible material comprising a metal film having an aluminum component, since aluminum sheet is flexible), for dishwasher (col.2, L.56-57).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the dishwasher of combined teaching of DE '882 and DE '567 by using a sheet of aluminum as the walls of the washing container as motivated by Williamson so that the walls do not deteriorate when moisture condenses thereon (Williamson, col.2, L.58-59), thus enhance the lifetime of the dishwasher.

***Response to Arguments***

11. Applicant's arguments filed 06/11/2010 have been fully considered but they are not persuasive.

12. Applicant argues that in DE'567 the heat conductivity of the heat insulation material is not dependent, or only slightly so, upon the gas pressure in the vacuum heat insulation panel. The Examiner's position is that DE'567 does teach the thermal conductivity value of the heat conductivity insulation panel which is thereby dependent on the pressure of the capsule because DE'567 clearly shows that when the pressure increases, the thermal conductivity value also increases (Translation of DE'567, P.2, L.16-20).

13. In response to applicant's argument that the references fail to show certain features of applicant's invention, it is noted that the features upon which applicant relies (i.e., the heat damping layer of the dishwasher according to the invention contains an evacuable material having a comparatively coarse pore structure which changes its thermal conductivity more strongly than nano-microstructured substances in the event of small vacuum pressure fluctuations) are not recited in the rejected claim(s). Although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

14. Applicant argues that Tilton does not teach the heat damping layer is disposed between the sound-damping layer and the walls of the washing container. The Examiner's position is that the dishwasher of combined teaching of DE 196 22 882, DE

196 47 567 and Tilton et al teach the heat damping layer is disposed between the sound-damping layer and the walls of the washing container. This is because the dishwasher of combined teaching of DE'882 and DE'567 teach the heat damping layer being disposed in surface contact with at least part of the wall of the washing container (DE'882, Fig.3, the wall of #1, read as projecting structure); and Tilton et al teach a dishwasher comprising a sound damping layer (Fig.1a, #26, abstract) surrounding a washing container, wherein the sound damping layer fits snugly around projecting structures so as to eliminate gaps between the layer and the structures and therefore acoustical leaks associated with those gaps (Tilton et al, col.2, L.51-54). It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the dishwasher of combined teaching of DE '882 and DE '567 by adding a sound damping layer surrounding the washing container, wherein the sound damping layer fits snugly around projecting structures (in this case, the heat damping layer) as motivated by Tilton et al so as to eliminate gaps between the layer and the structures and therefore acoustical leaks associated with those gaps (Tilton et al, col.2, L.51-54). Therefore, the heat damping layer is disposed between the sound damping layer and the walls of the washing container in the combined teaching of DE '882, DE '567 and Tilton et al.

### ***Conclusion***

**THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to STEPHEN KO whose telephone number is (571)270-3726. The examiner can normally be reached on Monday to Thursday, 7:30am to 5:30pm EST.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Michael Kornakov can be reached on 571-272-1303. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
